

Table 12. Estimated density and abundance of white-sided dolphins identified with high, medium and low confidence from the primary platform and abundance corrected for perception bias from the primary platform ( $N_c$ ). Only effort by the dedicated vessels conducted in B-T mode is used.  $n$  - number of sightings;  $L$  - effort (nm);  $E(S)$  - group size;  $esw$  - effective search half width (m);  $f(0)$  - probability density of the detection function at distance 0;  $D$  - density of animals (number nm<sup>-2</sup>);  $N$  - abundance,  $N_s$  - uncorrected for perception bias,  $N_c$  - corrected for perception bias; LCL and UCL - upper and lower confidence limits;  $p(0)$  – probability of detection at distance 0.
