

# Xtra Pure

## Enriching the Pure CRIS through MySQL

### What is Xtra Pure?

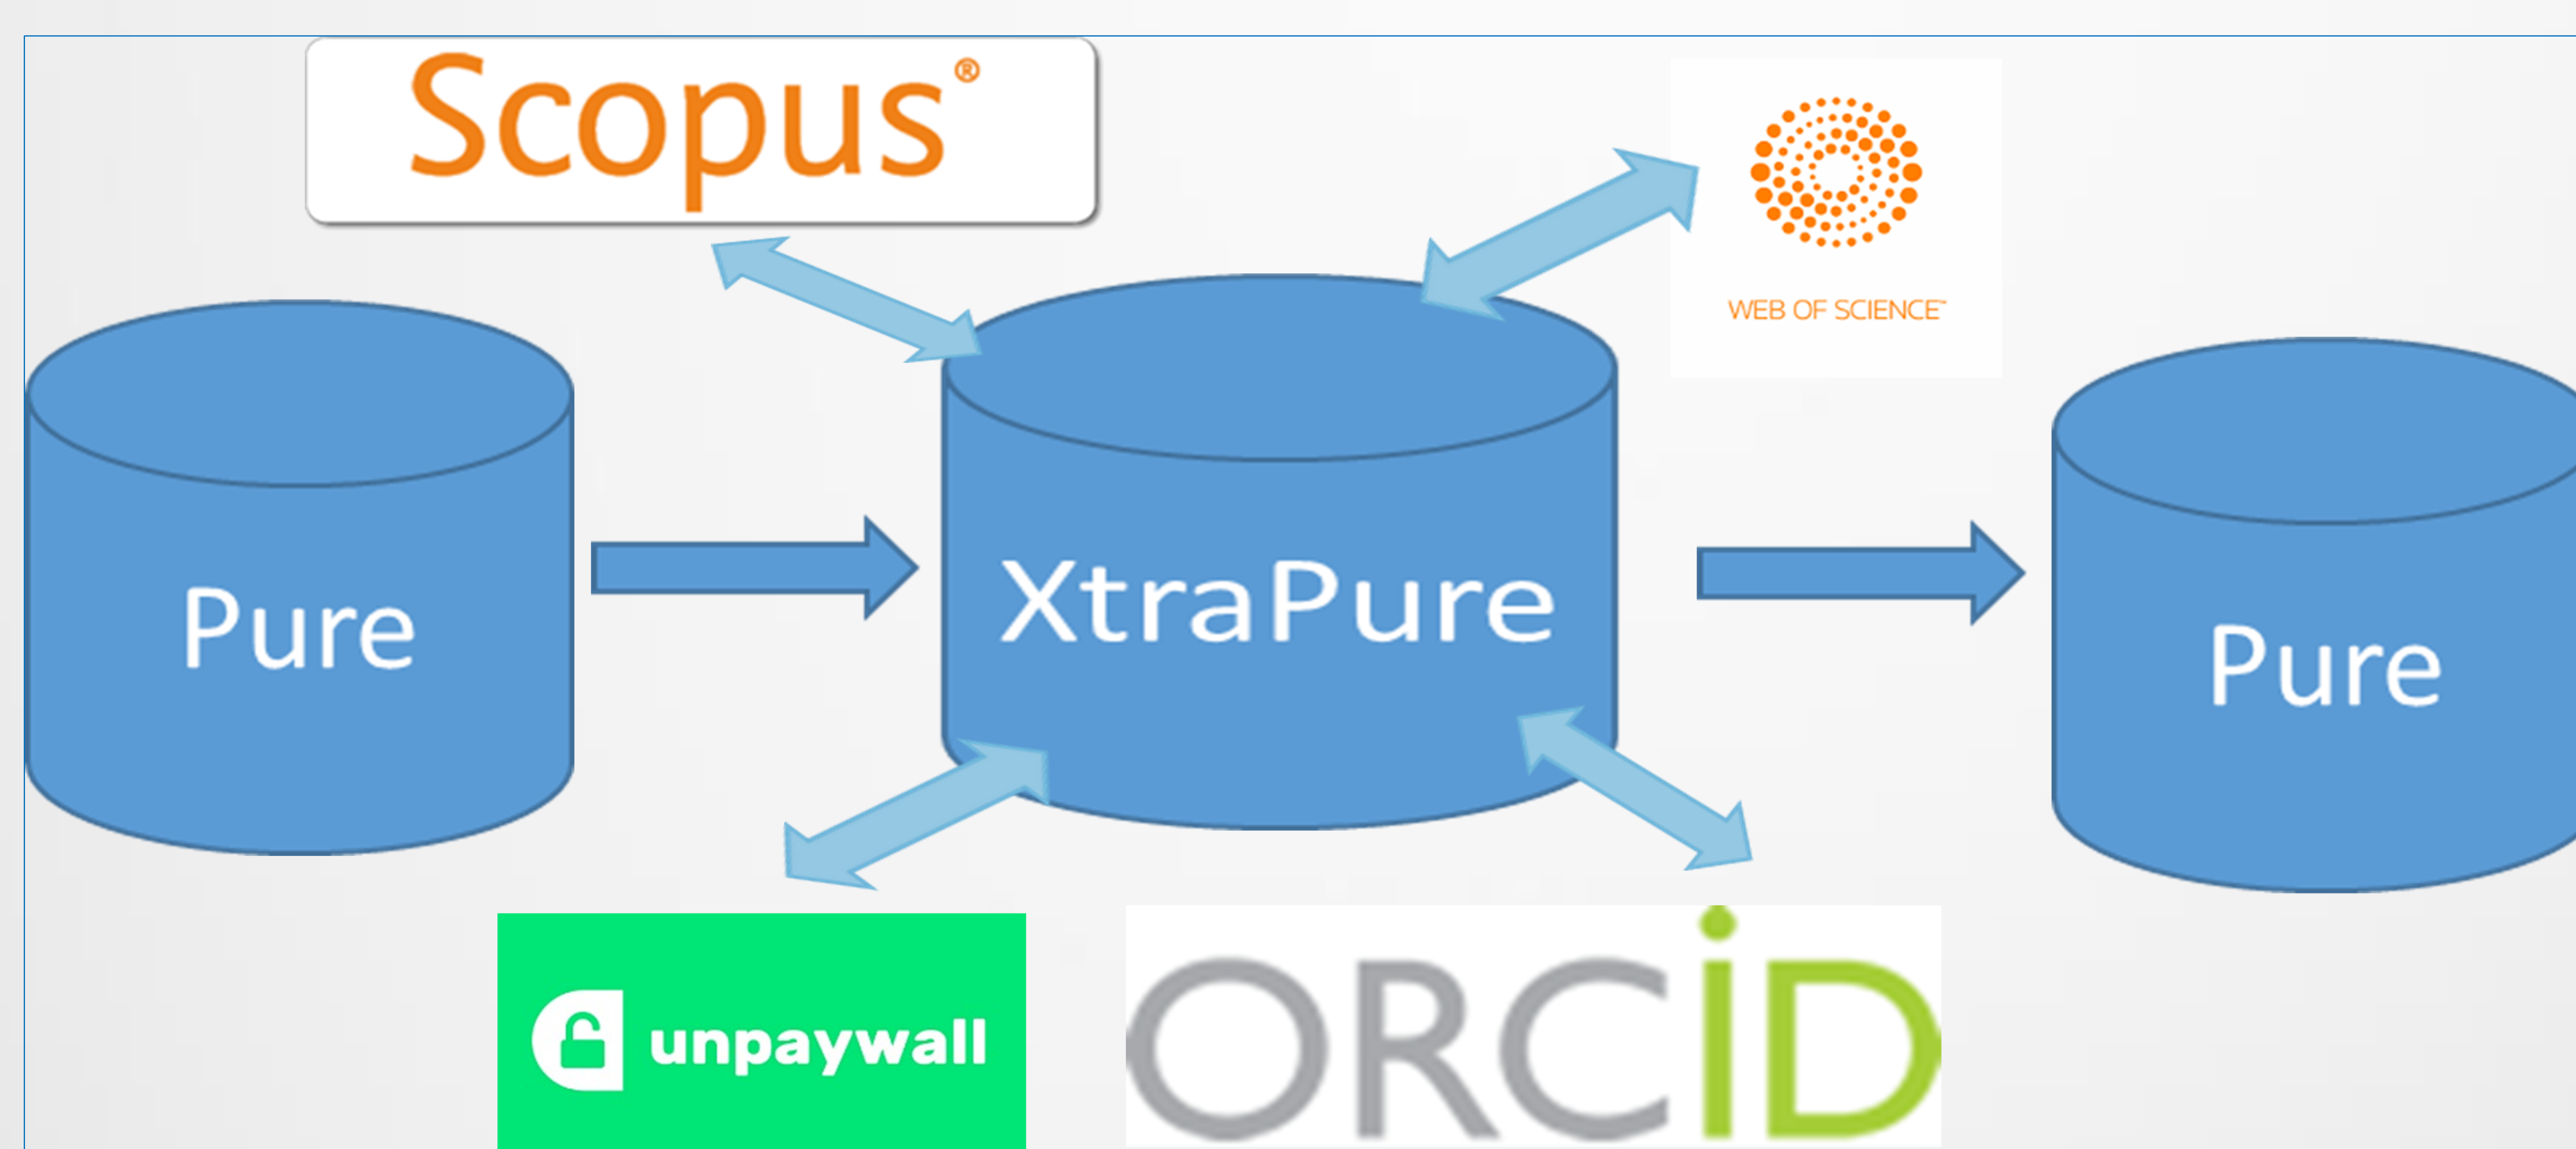

- An internal MySQL Database that enriches publication metadata in Pure from various online resources.

#### Matches Publications based on:

- DOI
- EID (Scopus ID)
- ISSN + volume + pages

#### Imports metadata regarding:

- Author and affiliation (Scopus)
- Open Access Status (Unpaywall)
- Citation counts (Web of Science)

### Why the VU uses Xtra Pure?

- Allows for more precise matching than the Pure API.
- Allows for more flexible querying than Pure reports.
- Allows for importing OA information from Unpaywall (unavailable through the Pure API).
- Allows for importing prior (pre-VU tenure) publications with correct affiliation (*not yet implemented*).
- Allows for visualization of data (for example through integration with Power-BI (*not yet implemented*)).
