

Våre Hjortedyr – en bok til undring, glede og kunnskap

bok til undring, glede og kunnskap is an essential reference for anyone interested in deer biology. It covers topics like history and ancestry of the different deer species, distribution, ecology, nutrition physiology, general physiology, bioenergetics, genetics, population dynamics, hunting and population management. The text is supplemented with 211 highlighted fact-boxes (photos, figures, illustrations, tables and explanatory comments) to make in-depth studies of various subjects possible. A comprehensive reference list and a list of key words to facilitate searching, completes the book.

This book is an important and valuable resource for students, for researchers and teachers in biology at universities and colleges, and for staff at various authorities related to wildlife biology and management. In addition, hunters and people with a general interest in nature and biology will have great benefit of the book.

Våre Hjortedyr – en bok til undring, glede og kunnskap (“Deer of the north - A book of fascination, joy and knowledge”, in Norwegian) starts with a chapter of general information about the four different deer species (*Cervidae*) included, specifying the similarities and differences between the species. After that, the four main chapters “Reindeer and Caribou”; “Moose”; “Deer”; and “Roe Deer” are introduced along with supplementary species-specific themes.

The book is up-to-date with published scientific literature (up to 2017). All the facts and information included is presented in an easy-to-understand, popular science language by the knowledgeable author. *Våre Hjortedyr – en*
